A pharmaceutical preparation having improved release properties

## Description

## Technical\_field

The present invention is related to a pharmaceutical preparation for oral administration, having improved release properties, to a method for preparing such preparation and to a method of obtaining an improved profile of release of a drug in the body of an animal or man.

10

The object of the invention is to obtain a preparation which releases a major part of its drug contents in the lower part of the intestinal system preferentially in the large intestine i.e. colon.

15

# Background\_art

The present knowledge of control of the release properties in an oral pharmaceutical preparation is great and rapidly growing. Especially the use of coatings in order to obtain 20 a desired release rate or release at a desired location in the gastro-intestinal system has been described in a number of publications among which US Patents 2 858 252, 2 853 420 and 3 835 221 could be mentioned as illustrative examples. A number of preparations including an enteric coating on

tablets or small granular bodies are thus known.

In certain disease conditions it is strongly desirable to obtain drug release mainly in the large intestine or in the lower fourth of the small intestine. This is the case e.g. with drugs used in the treatment of inflammatory conditions in the colon or lower ileum e.g. Colitis ulcerosa or
Morbus Crohn. Another therapeutic area where such release
properties are desired is the removal of excessive amounts
of bile acid in the colon using e.g. an anion exchanger
such as cholestyramine. However, no preparation providing
the desirable release properties is available.

In U. S. Patent No. 3,957,523 a preparation with a coating composition is described, which has the object of providing a controlled intestinal release of a drug. Said coating composition comprises a mixture of an enterosoluble cellulose derivative having monoester linkages with a polybasic acid and a digestive fluid-insoluble cellulose derivative.

In the case that one or both the two components are selected from vinyl polymers and acrylic polymers the intended object of the invention thus known is stated not to be obtainable.

U. S. Patent No. 3,431,338 describes a pharmaceutical
composition comprising (1) a medicament-containing nucleus,
coated sequentially with (2) a layer of an acid-soluble
coating material which is resistant both to alkalis and
intestinal juices, (3) a water-soluble intermediate layer,
and (4) a layer of an alkali soluble coating material which
is resistant to acid and gastric juices. Such composition
is said to enable release of a drug such as emetine or
dehydroemetine in the lower sections of the small intestine
and the colon, as concluded from release tests on coated
tablets. However, such sequential build-up of a coating is
technically highly inconvenient and apt to give a product
with unreliable properties.

## Disclosure of Invention

According to the present invention it has been found that by providing a core containing a therapeutically active substance with a coating of a specified composition the release of the active substance can be directed to the colon or the lower part of the ileum or both as desired, while disadvantages of previously known preparations\_are avoided.

10

Thus, the present invention provides an oral pharmaceutical preparation comprising a core containing a therapeutically active substance and a coating, characterized in that the coating comprises an anionic carboxylic acrylic polymer soluble only above pH 5.5 in an amount of 10 to 85 per cent by weight of the coating and a waterinsoluble polymer selected from quarternary ammonium substituted acrylic polymers in an amount of 15 to 90 per cent by weight of the coating. The coating normally has a thickness of 3-60 μm, preferably 10-30 μm.

The core may contain the active substance in admixture with carrier material or on the surface of a carrier particle, or the core may be made up of active substance only.

By an anionic polymer is meant a polymer containing anionic groups. For the purpose of this invention such polymer should be soluble above pH 5.5. Preferably the amionic carboxylic acrylic polymer is selected from partly methyl esterified methacrylic acid polymers.

Suitable waterinsoluble quarternary ammonium substituted acrylic polymers are polymers sold under the names

Eudragit RS and Eudragit RL, having an ammonium substitution of about 5 and about 10 per cent by weight, respectively.

Suitable partly methyl esterified methacrylic acid polymers are sold under the names Eudragit L and Eudragit S.

According to a preferred embodiment of the invention the

coating composition additionally comprises a plasticizer selected from fatty alcohols or fatty acids. Especially suitable plasticizers are cetanol (cetyl alcohol) and stearic acid. The amount of plasticizer is suitably up to 25 per cent by weight of the coating.

Preferred therapeutically active substances to be included in a pharmaceutical preparation of the invention are salicylazo-sulfapyridine, 5-aminosalicylic acid and cholestyramine, as well as salts and related compounds having similar therapeutic properties.

The coated cores of the invention are to be included in dosage units. Normally each dosage unit contains at least about 10 bodies. Preferably the minimum number of bodies is about 200. Among suitable dosage units tablets and capsules are specifically mentioned. Pharmaceutically acceptable additives may be included in the dosage units together with the preparation of the invention.

25

5

ě.

The cores of the bodies of the preparation may include pharmaceutically indifferent materials of the type normally used in pharmaceutical preparations, such as polysaccharides, microcrystalline cellulose, starch and waxes. The size of the cores may be sieve fractions between 0.1 and 3.0 mm, preferably between 0.5 and 1.5 mm.

Another aspect of the present invention is a process for preparing a pharmaceutical preparation as defined above, which process is characterized in that a large number of cores as defined above are provided with a coating as defined above by applying a solution of the coating composition to the cores. The coating is preferably applied by spraying the coating solution.

The solvents employed according to the process of the invention are solvents having a sufficient volatility to 10 evaporate under the conditions of application, leaving a layer of the solute on the surface of the core or body prepared. Preferably organic solvents such as alcohols, hydrocarbons and esters are used as well as derivatives thereof, such as chlorinated hydrocarbons. The process of 15 applying the coating may be carried out in an apparatus normally used in the pharmaceutical industry for coating of solid pharmaceutical preparations, preferably in a fluid bed apparatus. The process is normally carried out at ambient conditions, however, temperature and pressure 20 conditions may be varied within broad limits. In a fluid bed spraying process the temperature of the inlet air is suitably 15 to 60°C.

25 Furhter aspects of the invention are a coating composition as defined above and a method of obtaining release of a therapeutically active substance in the lower part of the intestinal system and a method of treatment, both employing the preparation defined above.

30

35

The invention takes advantage of the fact that the time of passage through the small intestine is rather constant even in disease conditions connected with diarrhoea or obstipation. Thus, in man said time is 2 to 5 hours. According to the invention the change of pH from acid to about neutral at the pylorus is employed as a trigger mechanism changing the physical condition of the coating

and finally causing release of the active substance after a predetermined lag time.

# <u>Experimental</u>

5

# Tests on release properties

As a model substance for study of the release properties salicylazo-sulfapyridine (SASP) was used. SASP is absorbed to a small extent in the stomach and the small intestine. In the colon it is completely broken down by bacteria to sulfapyridine (SP) and 5-amino-salicylic acid (5-ASA) which are then absorbed.

With a conventional preparation of SASP about 5 % of the dosage is excreted as SASP in the urine due to absorbtion in the small intestine. The total excreted amounts of SP and 5-ASA are about 75 % and 25 % respectively. With a colon release preparation the excreted amount of SASP would be strongly reduced while the excreted amounts of SP and 5-ASA would be substantially unchanged or increased.

#### Preparation

25 The test preparation were prepared as follows:

SASP (2000 g), lactose (1960 g), cetanol (120 g), were mixed for 10 minutes in a planet mixer. Water (1000 g) containing 25 g carboxymethyl cellulose was then added slowly for 2 minutes whereupon the mixing continued for 10 minutes. The wet mixture was then extruded and spheronized. The granules were then dried at 50°C for 1 hour in a fluid bed. The cores had the following sieve analysis:

|   | Sieve size mm | Per cent w/w |
|---|---------------|--------------|
|   | > 1.2         | 23           |
|   | 1.2 - 1.0     | 67           |
| 5 | 1.0 - 0.75    | 10           |
|   | < 0.75        | <del></del>  |

# Tests in vitro

The rate of release of SASP was determined by the beaker method (Levy et al., New England Journal of Medicine, vol. 262, p. 1053-1058 (1960)) at 37°C and 100 rpm in phosphate buffers having pH 6.7 and 7.0. Samples were taken at different times and the amount of SASP released was determined spectrophotometrically. The cores were coated by airborne spraying. 500 g portions of granules were coated with each of the following coating solutions according to the present invention:

| 20 |                    | <u>Example 1</u> | Example 2 |
|----|--------------------|------------------|-----------|
|    | Eudragit RS 100    | 30               | 22        |
|    | Eudragit S 100     | -                | 13        |
|    | Eudragit L 100     | 30               | 7         |
| 25 | Cetanol            | 22.5             | 15        |
|    | Methylene chloride | 750              | 500       |
|    | Isopropanol        | 750              | 500       |

Release tests were made by the same method as with the core material. A conventional tablet preparation (Salazopyrin<sup>®</sup>) was also studied. The results of the release tests are given below.

### Per cent SASP released at pH 6.7

20

#### Tests in vivo

Seven healthy voluntary test persons with an average age
25 of 34 years (26-54) participated. The tablet and the two
preparations of the invention described above were tested.
The granular preparations of the invention were administered
in a hard gelatine capsule. All preparations were given in
one dose, randomized with a cross-over technique. Totally
30 a dosage of 2 g SASP of each preparation was given, i.e.
4 tablets or 7 capsules of each granular preparation.

After at least 10 hours fasting the test preparation was ingested with 200 ml water. Three hours later restrictions on feeding were lifted. All urine was collected for 4 days. At least 7 days passed between each test period. The urine samples were stored deep-frozen before analysis. All urine

samples were analyzed for SASP and acetyl-5-ASA by liquid chromatography methods. The latter substance, which is a metabolite of 5-ASA, was chosen for analysis as largely representing the total excretion of 5-ASA.

5

Statistic significance (p<0.05) was computed by paired t-test and Wilcoxon test.

Amounts excreted in urine of SASP and acetyl-5-ASA is 10 shown in the table below with mean values and SEM (standard error of the means).

Amounts of SASP and acetyl-5-ASA excreted in urine during 4 days after administration of 2 g of SASP:

15

|     | Preparation | SASP       |         | Acetyl-5-ASA      |
|-----|-------------|------------|---------|-------------------|
|     |             | M̄ ± SEM % | of dose | m ± SEM % of dose |
|     |             | (hwoje)    |         | (µmole)           |
| .20 |             |            |         |                   |
|     | Tablet      | 99 ± 15    | 2.0     | 1225 ± 106 24.5   |
|     | Example 1   | 37 ± 25    | 0.7     | 922 ± 120 18.4    |

35

#### Comments

The preparations of the invention according to Example 1 and Example 2 gave a significantly lowered amount of excreted SASP as compared to the tablet. Between said two 30 preparations of the invention no significant difference was found. The excreted amounts of SASP in urine decrease with decreasing release rate in vitro. The amounts excreted of acetyl-5-ASA was not significantly different between the three preparations tested.

The results confirm that a preparation giving the desired release properties is obtainable by the present invention.

The invention is further illustrated by examples and release tests according to the beaker method given in the table below.

|            |                           |         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                      |             | . 1                   |     |                |                                 |                                  | 00 |

### Footnotes

- Cores had a composition and were prepared as described under "Tests on release properties" above.
  - 2) Compressed 100 % acetylsalicylic acid granules (ASA-Gran, Monsanto).
- Cores in Example 7 consisted of 75 % active substance, 25 % cellulose avicel and 5 % poloxalene (Pluronic ).

  The cores were prepared by the process referred to under 1).

15

20 Best\_mode\_of\_carrying\_out\_the\_invention

The best mode of carrying out the invention is the embodiment according to Example 7 above.

25

#### Claims

- An oral pharmaceutical preparation comprising a core containing a therapeutically active substance and a
   coating, characterized in that the coating comprises an anionic carboxylic acrylic polymer soluble only above pH 5.5 in an amount of 10 to 85 per cent by weight of the coating and a waterinsoluble polymer selected from quarternary ammonium substituted acrylic polymers in an
   amount of 15 to 90 per cent by weight of the coating.
  - 2. A preparation according to claim l, characterized in that the anionic carboxylic acrylic polymer is selected from partly methyl esterified methacrylic acid polymers.

15

\*

3. A preparation according to one or more of the preceding claims, characterized in that the coating composition additionally comprises a plasticizer selected from fatty alcohols or fatty acids.

20

35

- A process for preparing an oral pharmaceutical preparation comprising a core containing a therapeutically active substance and a coating, characterized in that a large number of cores are coated with a composition comprising
   an anionic carboxylic acrylic polymer soluble only above pH 5.5 in an amount of 10 to 85 per cent by weight and a waterinsoluble polymer selected from quarternary ammonium substituted acrylic polymers in an amount of 15 to 90 per cent of the coating, by applying a solution of the
   composition to the cores.
  - 5. A coating composition characterized in that the dry substance thereof comprises an anionic carboxylic acrylic polymer soluble only above pH 5.5 in an amount of 10 to 85 per cent by weight and a waterinsoluble polymer selected from quarternary ammonium substituted acrylic polymers in an amount of 15 to 90 per cent by weight of the coating.

6. A method of obtaining release of a therapeutically active substance in the lower part of the intestinal system of an animal or man, characterized in administering orally to such host a preparation according to claim 1.

5

10

- 7. A method of treatment of inflammatory conditions in.
  the colon or lower ileum in an animal or man, characterized
  in administering orally to a host suffering from such
  conditions an effective amount of a preparation according
  to claim 1.
- 8. An oral pharmaceutical preparation, a process, a coating composition, a method of obtaining release or a method of treatment as claimed in one or more of claims
  1-7 and substantially as described.
